Global Caché announces Global Connect-- a line high performance networking hardware connecting infrared, serial, contact closure and sensor input to wifi networks, wired TCP/IP networks and HTTP web-based applications.

Installers can further increase Global Connect device functionality by adding local computing power via on-board Raspberry Pi (Linux), on-board HDMI switching and advanced and more powerful relay applications.

“Global Connect is the result of 15 years of experience serving and listening to dealers and installers all over the world," the company says. "Global Connect delivers an innovative solution that integrators need to remain flexible and competitive in this quickly changing and expanding industry. We can now provide a cost-effective, yet unique product suitable for each individual job regardless of the type of controller or control app being used, or scale of the project.”

The Global Connect portfolio will be on show at InfoComm 2017, before shipping starts on August 2017.
