AudioControl launches the Director Model D4400 multi-zone amplifier-- offering 16 amplification channels at 100W per channel as well as on-board DSP, graphic and parametric equalisation by zone, network monitoring, and programming and control.

Users can select individual channels and zones via standard TCIP, bridge channels up to 200W per channel, remote 12-volt zone trigger via ethernet, and operate stable into low impedances while delivering power and performance.

Being networkable, the D4400 allows installers to control and monitor operation and performance both on-site and remotely via browser-based UI.

A sizeable DSP feature set includes graphic and parametric equalisation for each channel (with 128 filters), programmable electronic crossover, subsonic filters and high frequency tweeter protection circuits, dual bus inputs, channel status monitoring, email alerts and selectable user listening preferences.

The Director Model D440 comes in a compact 3U chassis with removable rack mounts as standard feature, and is available in either black or brushed stainless steel.
