High-end audio maker StormAudio announces a partnership with Dirac Research-- and adds Dirac Live room calibration and sound optimising technology to its StormOptimiser room calibration software.

Dirac Live will become a standard feature in newly purchased StormAudio processors, and is available as a free DSP runtime firmware update for already installed products.

“At StormAudio, it’s our mission to provide our integrators and end-users with exceptional sound and service, and our agreement with Dirac enables us to achieve both,” the company says. “Dirac Live has been well recognised as the best room correction solution on the market. Advanced yet simple to use, Dirac Live will be a powerful tool for our integrators-- they will deliver a premium listening experience to their customers while spending less time on site.”

Dirac Live is a patented room correction technology able to correct both frequency response and impulse response of loudspeakers in a room. It offers "true impulse response correction" over a large listening area, improving the depth, positioning and distinction of individual voices and instruments using multiple measurement and mixed phase correction.

Other high-end audio manufacturers already use Dirac Live, as well as blue chip technology companies in the automobile and mobile industries.
