Amphion Loudspeakers announces the Helium410, Helium510, Argon0 and Argon1-- bookshelf loudspeakers with redesigned cabinets and, in the case of the two Helium models, higher class components.

The major cabinet change in the smallest Helium and Argon models involves the repositioning of the reflex tube behind the woofer. According to the company the change improves bass response and enhances the clarity of the midrange.

In addition, the Helium410 and Helium510 employ a new tweeter said to provide a cleaner and wider listening area compared to the previous one. The result brings the three-dimensional sound to a new level, be it as part of a stereo setup or a complete home theatre installation.

The Helium410 and Argon0 desktop speakers also have a new woofer grid design.
