Finnish studio monitor maker Genelec unveils the S360 at ISE 2019-- a smart active loudspeaker featuring a professional level of performance making it ideal for both residential and commercial application.

The S360 features a 10-inch high efficiency woofer and a 1-inch titanium diaphragm compression tweeter housed in an extended directivity control waveguide, housed in a low diffraction enclosure with Finnish woodwork. The result, the company says, delivers neutral reproduction with a short-term SPL capability of 118dB with even higher peaks. It is also features a long-throw capability, being able to deliver studio quality accuracy at listening distances of over 10m.

Mounting also promises to be flexible, with down-firing reflex ports allowing for free-standing, in-wall or on-wall positions. An innovative Iso-Plate decouples the monitor from the base when standing, while preventing air turbulence. In addition, customers can order the electronics either integrated in the enclosure or positioned remotely through a 2U rack kit.

The speaker also integrates with GLM software for configuration, calibration and control. The software also doubles as a monitor controller, allowing one to calibrate listening levels, switch between formats, monitor systems and primary listening positions, and more.
