Sonos launches a gen 2 version of the One wireless speaker-- one featuring improvements including Bluetooth Low Energy, a faster processor and more memory, all within an external design identical to the first generation model.

Products

The updates Sonos One does not appear to have exclusive features, and sound performance should be the same. The company is also still to detail how the gen 2 One benefits from the processor and memory update, even if it previously stated some older speakers lack the horsepower to support AirPlay 2. Then again, the gen one Sonos One will be getting AirPlay 2 support.

That said, the addition of Bluetooth LE should make for easier first-time setup of the speaker, since the protocol allows for quicker temporary communications between speakers and mobile devices. The Sonos One also supports Alexa voice control, and Google Assistant should be arriving on a future date.

The gen 2 Sonos One is available now.
