James Loudspeaker announces the addition of a microperf grille for the Small Aperture architectural loudspeaker range-- grilles with smaller perforations for a less obtrusive, almost invisible presentation.

According to the company the microperf grilles nearly vanish into any décor while providing nearly identical frequency response and dispersion to the original grilles.

Small Aperture speakers incorporate proprietary aluminium drivers. Available in 3- way and 2-way versions, each speaker is housed in an aluminium enclosure designed to minimise resonances and enhances durability, even in high humidity. James Loudspeaker says the Small Aperture speakers deliver room-filling full-range musical playback, including clearly defined bass response, eliminating the need for external subwoofer modules in most system designs.

The microperf grilles will come as standard on all James Loudspeaker Small Aperture models, and are available now.
