Atlantic Technology announces the FS series-- a pair of compact powered subwoofers designed to deliver bass to any TV, soundbar or audio system claiming combine the versatility of both wired and universal wireless connectivity.

The two models in question are the 100W amplified FS-S65 with a 6.5-inch woofer and the FS-S8, the 8-inch, 105W model. Both use low-latency SKAA wireless audio technology to seamlessly work with the Atlantic Technology line of wireless multi-room SKAA speakers, soundbars and amps, as well as any other brand of soundbar, TV, AVR or audio source.

The thin form-factor subwoofers come in a sturdy MDF enclosure for low distortion and deep bass in a compact cabinet just 18cm deep. The FS-S65 is finished in an all satin black finish, while the FS-S8 features a high-gloss piano black finish. Such a thin cabinet allows for superior placement versatility, allowing customers to position the subs vertically behind a couch, or horizontally under furniture. Installers can also wall-mount them.

To match with any system the FS series includes versatile optimisation controls. Adjustable

50-300Hz, 12dB per octave low-pass crossover delivers good blending with satellite speakers or soundbars, and make the woofer less localisable. The long-throw bass driver uses a vented magnetic motor structure and a high temperature, 4-layer aluminium voice coil. The level control matches output volume to the rest of the system, and a 0/180-degree phase switch allows for better acoustic matching with satellite speakers.

The FS series is shipping now.
