Danish hifi, pro-studio and automotive speaker specialist Dynaudio confirms its commitment to the CI and AV sectors as it joins The CEDIA Designer's (TCD) global cloud-based design software database.

TCD helps installers design and create cinema or media rooms using products from a wide range of manufacturers. Dynaudio products currently available on TCD include the Emit and Contour hifi speaker ranges, together with the Cinema Master 60 reference LCR speaker, the Studio series architectural range and the Sub3 and Sub6 active subwoofer. Future products will be added as they hit the market.

Using TCD installers can make technically accurate designs, as well as peer-reviewed standard cinema designs and documentation. It provides support documents such as audio and video calibration reports, and accurately and aesthetically presents the finished room. Finally, it produced a 3D CAD drawing of any room in under 30 seconds. An immersive VR render functionality allows one to email an immersive VR render file to clients, without need for specialist viewing equipment.

“At Dynaudio we want listeners to experience music or movies the way the artists and producers intended,” the company says. “We engineer products which deliver that ethos, but even the best speakers need to be paired with the right electronics and a good listening environment. That’s why we’re so pleased to have partnered with The CEDIA Designer. It also makes the integrator’s lives so much simpler by helping them provide a polished, bespoke proposal to their client in a fraction of the time it could otherwise take.”

Dynaudio Joins The CEDIA Designer Manufacturer Database
