Extron starts shipping the DSC HD-HD-- a compact HDCP-compliant scaler able to convert between HDMI resolutions and frame rates ideal for applications requiring the scaling of HDMI video with different sources and displays.

It handles video from 480i up to 1920x1200, 1080p and 2K, and offers upscaling and downscaling with multiple output rates up to 1920x1200, including HDTV 1080p/60 and 2K.

Advanced video processing provides 1080i deinterlacing and Deep Color processing for optimal image quality, while installer-friendly features include on-screen display, test patterns and EDID minder.

Remote configuration and control are also available via USB.

A compact form factor allows simple integration at a source, destination or distribution system.

"AV integrators often need a simple solution for matching different HDMI video resolutions in professional AV systems," Extron says. "The DSC HD-HD includes a powerful scaling engine and video processing capabilities that ensure consistent, reliable HDMI cross conversion with great picture quality."
