Peerless-AV presents a wireless HD transmission system-- the PeerAir Wireless HD Multimedia System (HDS-WHDI100), a means to send 1080p video up to 33m, even through walls, ceilings and other boundaries.

The PeerAir system creates an own 802.11n wireless network. The enhanced version adds a metal case design and external directional antennas to provide a reliable and robust signal. Installation promises to be plug-and-play, while the receiver gets an IR extender allowing customers to store it out of sight.

The system is ideal for both residential and commercial applications. In residential settings, the PeerAir allows the installation of TVs in tough-to-wire locations without need to cut through walls to hide HDMI cables. Also included is HDMI passthrough, allowing source devices to display content on a hardwired TV while streaming the same content to a remote TV, eliminating the need for an extra cable box.

In corporate settings, the PeerAir is ideal for offices in need for more connectivity without need for extra wiring, or eliminating the hazards wires from desks, podiums, displays or projectors pose to children.

The HDS-WHDI100 is available now.
