CEDIA Expo 2018 sees Just Add Popwer (J+P) demonstrate the 3G UltraHD over IP series Daisy Chain Receiver and launch Just OS, a family of firmware and app-based solutions for video distribution control and management over any network.

The VBS-HDIP-3G 509POE Daisy Chain Power-over-Ethernet (PoE) receiver distributes UHD and 4K video over a single Cat-5e cable. An onboard passthrough network port allows the connection of any PoE device-- a network soundbar, IPTV control or single display location can be expanded into a video wall. The receiver also expands the number of PoE one can add to the system by connecting a PoE switch to the port.

J+P will also demonstrate the Just OS firmware family, built using the Representational State Transfer (REST) API widely used in IoT application development. It enables ESS capabilities, developed to allow installers to build any size 4K matrix on an existing network without changing switches. It also brings together the J+P Switch Please and Plug-Play-Present solutions under one umbrella.
