The InfoComm 2019 lineup from Just Add Power includes the 767DSS Dante Enhanced Sound System transmitter-- a means to add compatibility with Dante and AES67 audio networks to Ultra HD over IP systems, with separate audio and video switching.

The 767DSS transmitter supports the latest Dante 8-channel chipset. It allows installers to input up to 8 audio channels from the J+P system for playout on Dante-enabled and AES67 devices and extract up to 8 channels from the audio network for playout across the J+P system. The 767DSS is backward-compatible with legacy 2-channel Dante and AES67 devices, while offering higher performance with lower compression (176.4 and 192kHz) and latency as low as 0.25 milliseconds on Gigabit ethernet. Built-in secondary connectivity provides glitch-free performance and redundancy for high-availability applications.

Additional transmitters on show at InfoComm include the 726TVI, a means to add TVI support to the J+P 3G HD over IP system. The 726TVI eliminates the need for a TVI-HDMI converter in the IP video distribution chain, giving installers the flexibility to add an HD-TV source to 4K infrastructure. Features include line-in for custom audio embedding, local HDMI passthrough and USB 2.0 for passthrough camera control. Video image capabilities include push, pull and pop for on-screen customisation.
