At InfoComm, SurgeX launched **Axess**, a line of IP-addressable, surge-eliminating and power conditioning management systems that allow integrators to monitor and control power distribution platforms 24/7 via the Internet.

This system can customize, synthesize and monitor individual outlets and power settings on integrated IP-enabled devices via remote access. Custom sequences can be created across the entire network with email notifications sent about various power phenomena, base.

Axess line includes 2-way communication to monitor and manage system energy usage. The **A xess Elite**
line also collects temperature, voltage measurements and current draw measurements and reports back via a user-friendly energy and power usage display.

For more basic IP needs, SurgeX now offers a line of **Axess Ready** products. The base SurgeX products, including FlatPak, Space Savers and NEMA solutions can now be controlled over IP. All Axess Ready products are network attached and feature an intuitive user interface that makes operating the outlet and changing configuration parameters and give users the ability to remote reboot any device that is connected to the Axess Ready product as well as conserve energy by powering down equipment when not in use.

Axess and Axess Elite also feature the core technology behind the SurgeX brand: **Advanced Series Mode (ASM) Surge Elimination Technology**
. The SurgeX patented Advanced Series Mode Surge Elimination Technology claims to be completely non-sacrificial and eliminates surge energy without producing harmful side effects such as ground contamination or common-mode disturbances.
