

Home awareness and energy management brand enerG will debut at the CEDIA 2013 Expo where it will show off its Z-Wave-based home automation platform, the Home Awareness System.

The platform allows homeowners to control, customise and automate all connected devices in the home, and receive important system notifications on Android and iOS devices.

The enerG starter package consists of a gateway hub, thermostat and a pair of enerG switches. Customers can further expand the system to include lighting control, garage door access, keyless entry and wireless HD viewing.

Connected device management comes through either enerGhome.com portal or mobile apps, where users can monitor device and home energy consumptions as well as set energy goals.

The system incorporates Geo-Fencing, a technology allowing homeowners to define rules or adjust settings when people leave or approach the home (such as automatically adjusting HD viewing or temperature). The technology triggers settings via smartphone GPS.
