The Savant SmartEnergy product line gets wifi connectivity through a trio of product launches-- a wifi-enabled wall plug, power strip and current sensor.

Designed to provide energy management data at cost-effective price points the devices do not require rewiring, making them ideal for retrofit applications.

The Wifi SmartPlug delivers power measurement for individual appliances, and the power strip provides 6 outlets (4 managed receptacles, 2 unmanaged). Both feature surge protection, as well as remote on/off control via TrueControl apps.

Meanwhile the current sensors allows the monitoring of a hardwired single circuit without need for an accessible plug.

"As a larger segment of the population has become focused on energy usage, Savant is determined to give integrators more tools to address this growing market demand," the company says. "Savant has been an innovator in this arena with our SmartEnergy solutions and these new Wi-Fi power management products broaden our offerings and will bring critical energy usage data to the homeowner."

All the new Savant energy management devices will be available from Q4 2013.
