A startup called Linxter is set to launch a hosted messaging platform that will enable any Internet-addressable device, application or system to communicate with another.

The platform is made of: an "internet Service bus" to processes the messages being sent; a software development kit; and a web interface for admin. "With everything around us becoming Internet enabled (iPods, clothing, toasters... anything), it is essential that we have a system in place to securely, easily, and dynamically connect all these things," says the company's web site.
