

Nest Gets Watch Control

Written by Marco Attard

The Nest smart thermostat gets a much wanted addition-- the latest 5.6.0 update to the Nest iOS app includes Watch support, allowing users to adjust home temperatures from their wrist.

The update also includes a few UI tweaks, such as a "Spaces" feature to organise Nest products according to the room they reside in, means to check all camera feeds simultaneously and the ability to share live camera video feeds with trusted 3rd parties through a password-protected website.

Mind, this is not the first time Nest added wrist-based controls to its thermostat-- the feature is already supported on smartwatches powered by Google's Android Wear. Either way, Watch users can download the update from the link below.
