Janus Technology releases a new Control4 KNX universal thermostat driver-- one designed to integrate simply to work in conjunction with the existing Control4 KNX network driver.

The company says it developed the driver embedded with knowledge of various manufacturers and models, and the different ways of controlling them. Current manufacturers include ABB, Gira, Jung, Basalte and Zennio, among others. Janus says it can add support for more thermostats on request "within a few days."

To install the driver one needs to select to the manufacturer/model, and the visible properties within the driver are adjusted to display properties relevant for the configuration of the specific device, including the selection of operating mode switchover (heating/cooling).

Additionally the Control4 GUI can be configured to allow access to extra capabilities related to the thermostat and/or zone it is located with from the EXTRAS tab in the interface. This can include extraction fans, heated towel rails and so on.
