Blind control maker QMotion highlights the QiS system at ISE 2018-- a two-way wireless control system for automated roller shades featuring quiet-running motorised blinds suitable for retrofit projects.

Installers can deploy a QMotion QiS system in single or multiple rooms within a property, and receive feedback on automated shade positioning for improved performance, remote monitoring and maintenance. One can group blinds for automated raising and lowering to four selected, programmable positions. Safety braking ensures blinds never pass over the top of the roller when rising, and a manual-override command allows customers to operate the blind by hand when required without damaging the mechanism inside.

ZigBee HA 1.2 allows for easy setup, configuration and integration with compatible devices within a Control4 home automation system. Drivers are also available for integration with Crestron, Vantage, Savant, URC, RTI and others via QMotion Qube integration device. ISE 2018 also saw the announcement of new integration partners, namely Bang & Olufsen, Loxone and Rako.
