Customers get an interesting option for a smart lighting control product-- the Velux Active smart roof windows/skylights use Netatmo intelligence to monitor sunlight, humidity, temperature and CO2 levels.

First announced back at CES 2017, the Velux Active skylights automatically adjust open/close levels, as well as motorised shades. The solution includes a wifi gateway and controls for Velux Integra roof windows and sunscreen products, plus an iOS/Android control app. As for sensors, the company offers weather gauges, rain gauges, wind gauges, security cameras and indoor air quality monitors, and the "with Netatmo" program allows integration into smart home systems.

"Velux Active with Netatmo is the result of two stunning technologies-- high standard Velux skylights and Netatmo's know-how for creating simple and useful products and apps," Netatmo says. "By automating the opening, closing and shading of skylights, we can make a big difference and improve indoor climate so users don't have to worry about it."
