Savant adds Central Management and Studio to its software and services suite-- a pair of powerful tools promising to allow installers to modernise their businesses, increase productivity and provide valued services to customers.

Savant Central Management is a cloud-based tool accessible via mobile device, PC or Mac. It delivers secure access to every Savant deployment, complete with software revision tracking, remote diagnostics, time/date stamped system logs, host maintenance and configuration capabilities. At the core is the capability to protect the installer and client with permission-based secure access.

Installers can create internal access tiers, allowing limited access to a client's home and data. In addition, via the Savant Pro app, clients can consent to remote system access by the installer for as little as an hour or as long as the project requires. All permissions are time and date stamped. The tool also alerts installers to service opportunities, and provides remote access to software releases, firmware updates, access to revision history and host logs.

Meanwhile Savant Studio is an iOS-based field configuration tool for entry level end-to-end system design and deployment. It uses the Savant S2 Host, and supports the full range of features and services with Savant music, lighting, climate and more. Thus, system configuration can take place via either Savant Blueprint software on Mac or Studio on an iPad.

Savant Central Management stores all project files, configurations and revision history on the cloud. For the ultimate in deployment flexibility, configurations created in Blueprint are accessible via Studio and vice versa.
