The Basalte Deseo line of room controllers is Crestron Connected devices-- a partnership between the two companies allows installers to easily integrate the products in Crestron-based system designs to control lights, temperature and shades.

“We’re pleased to further expand our relationship with Basalte to give our residential dealers access to even more refined and innovative control options for their system designs,” Crestron says.

Discrete and minimalist, the handmade Deseo line provides a simple OLED UI. Highly sensitive touch sensors allow homeowners to easily navigate through frequently used functions within a room, while designer aesthetics and high-quality finishes allow the controllers to blend with any decor. Integration with Crestron systems takes place via direct Cresnet bus cable connection, and programming is in SIMPL Windows. No interfacing is required.

Crestron Connect allows interoperability among diverse, independently manufactured products to deliver on the Crestron promise of smarter homes running on best of breed technologies, all working well together.
