Control4 OS reaches version 2.10.4, with updates including an expansion of music streaming capabilities through more native streaming services and When >> Then features allowing more hands-on personalisation choices for customers.

The OS now offers Amazon Music and Deezer Hifi as music streaming integrations, and customers can add one or more music services directly from a mobile device or Control4 touchscreen via an "Add Music" capability. In addition, Control4 directly supports Deezer, iHeartRadio, Napster, Pandora, SiriusXM, Spotify, Tidal and TuneIn streaming services.

Meanwhile When >> Then allows customers to adjust certain smart home functionality independently, without involving an installer. One can create and edit voice scenes for Amazon Alexa, create custom buttons and programming for the recently introduced Intercom Anywhere, and modify lighting scene schedules. Installers can also unlock programming added through Control4 Composer Pro software, enabling homeowners to modify and add to pre-existing programming through When >> Then.

“Homeowners depend on the expertise of our dealers to design and install reliable, experientially-rich smart homes, but homeowners also want the flexibility to personalise and change scenes and automated events on their own,” the company says. “We’re empowering homeowners to fine-tune their Control4 experience in ways that matter most to them-- how they listen to their favorite music, design lighting scenes, initiate voice control, and secure their homes.”
