Helios Labs has new software so Helios Odyssey media hub is compatible with uPnP devices as well as supporting P2P protocols such as BitTorrent and ED2K. This pushes Helios Labs closer towards a PC-less media center solution that directly connects the internet with HDTV in the living room.

The Helios Odyssey, a networking media hub capable of streaming content to multiple DMAs (network media adapter), wants to be the centerpiece for the future of digital media entertainment. The newly released software allows your customer to install a P2P download client directly on the Odyssey so that you can schedule download tasks via a web browser and have access to even more content on the Internet, all without the worry of power consumption or noise pollution of a PC.

Combined with up to 1TB storage capacity, the Odyssey now enables you to store, manage, access and keep track of all of your photos, music, downloaded clips, TV shows, movies and other random files effortlessly.

The Helios Odyssey will also be available to European customers in Q2 2008.
