---

Stealth Acoustics will launch its next generation of high-performance, invisible speakers at ISE 2013.

The new **LRG Series** offers improved audio quality from a thinner speaker to present dealers with the most attractive invisible speaker option available on the market.

Featuring a newly designed, low-profile high-power woofer for solid bass response down to 30 Hz, the LRG series is a full inch thinner than previous models, allowing simple, completely concealed installation within wall or ceiling cavities as shallow as 65mm (2.5") depth.

Stealth has also completely re-designed the speaker face to make it stronger and lighter yet able to provide superior acoustic performance. This proprietary radiating surface, called "Fidelity-Glass™", generates more delicate highs, a deep and solid bass output and overall better response.

## Next Generation of High-Performance, Invisible Speakers

“Today’s multi-channel surround sound and whole-house audio systems require multiple speaker locations. The result can be an ever growing number of speaker grilles, boxes and hardware that compete with the décor of the living space,” says Steve Olszewski, VP Stealth Acoustics. “Using all our 10 years’ experience as the leader in invisible speaker technology, we’ve developed the new LRG range to combine audiophile quality with total discretion. Installers can now provide dynamic full range audio from concealed speakers, placed precisely where the customer demands it”.

Visitors to ISE will also see how the LRG Series is simple to install. The paintable active diaphragm face is bonded to the frame of the speaker panel, creating an active area surrounded by a stable mounting frame which attaches directly to standard wall structures. This enables installation in either the wall or ceiling with on-site finishing options, including latex paint, light wallpaper, fabrics and selected texture coats.

The LRG series is available in a comprehensive range of size and output options. These include premium, full range (LR4G), three-way full range (LR3G), two-way full range (LR8G), two-way single stereo (SLR8G) and compact, two-way full range (LR6G) versions. Stealth also provides 100w and 120w sub-woofers together with high quality monaural and 8-channel amplifiers to complete the range.

Stealth Acoustics will also be using ISE to unveil a world first in speaker design, but you’ll have to wait for ISE for that news...
