

Avega Hooks Up Cisco, Maybe Apple

Written by Bob Snyder

Avega (the Australian Company who developed the next-gen of audio wireless technology now being used by Cisco) will roll out a video wireless system that will stream HD content over a normal 802.11n wireless network without a set top box.

Avega Systems is now a US entity. With the development team still based in Sydney this start-up could become a major CE player in the wireless audio market after investments of \$7 Million last year by Cisco Systems, JAFCO Asia and Technology Venture Partners

The core of the Avega offering is an 802.11n-based hardware platform and "skeleton" user interface that clients such as Cisco can customize. Other partners could offer different features, such as gesture recognition.
