

Connectivity product vendor Global Caché announces a partnership with Chaos Entertainment Communications, the Switzerland-based developer of the IRControl communications software.

The partnership ensures products from the two companies provide built-in integration, creating a simple and easy to deploy, configure and use solution. Global Caché offers products able to connect any IR, serial and contact closure device to a wifi or IP network for control, automation and maintenance by network-based software, while Chaos is the developer of IRControl, a CE and home automation control system running on Android.

Installers can customise the IRControl system through an integrated graphics editor allowing page layout, graphics, buttons and workflow design, and users unfamiliar with graphic design can use predefined layout templates.

"We're excited about this partnership with Global Caché, " Chaos says. "Our Android-based IRControl software is a perfect fit with Global Caché hardware and their cloud based IR database Control Tower. Our customers are looking for reliability and simplicity of deployment and use. The IRControl and Global Caché combo definitely delivers on that. We're confident our customers will be happy with this alliance."
