A Crestron partnership with Vitrea brings Crestron Connected status to the VTouch, a keypad featuring Cresnet connectivity for connection to any home network via standard ethernet cable.

The Vitrea VTouch keypad features a chic, modern design with unique features, including LED light identification and multi-press configuration. It comes in a variety of glass colours in standard or matte finish, as well as customisable glass panels.

Blue LED light surrounds the keypad, making it easy to locate in the dark, and the LED light intensity is fully adjustable. Single and double gang models are available with 1 to 16 keys, and installation is either standard or flush mount.

The Cresnet bus is the communications backbone for Crestron keypads, lighting controllers, shade motors, sensors and other devices. It is a simple yet flexible four-wire network providing bidirectional communication and 24DC power for Cresnet devices, and supports up to 252 devices.
