# A Performance UI for Crestron TS-310 Remote

Written by Alice Marshall
15. 01. 2019

Crestrron announces the Performance UI-- a user experience designed exclusively for the TSR-310 handheld touchscreen remote complete with native integration with the Pyng OS 2 operating system.

Minimal programming requirements reduce deployment time, and Crestron installers can download the latest Pyng OS 2 update to check how the TSR-10 UI instantly updates to Performance UI. Furthermore, Performance UI provides integrated media, lighting, shades and climate control, along with quick actions.

Performance UI adds smooth transitions and animations to industry standard actions, and being pre-built, the UI requires no design tools. The voice command interface is also built-in, further simplifying configuration.

"Crestron smart home automation is already renowned for ease of scalability, high performance, and unmatched reliability," the company says. "Now, with the Crestron Performance UI, our residential integrators can also deliver an incredible user experience that takes virtually no time to configure. It's the full package."
