The TouchLink Pro control systems from Extron make a complete AV control solution, being a combination of a TouchLink Pro touchpanel and an integrated IP Link control processor.

Such an all-in-one approach streamlines system designs by consolidating essential control system components, freeing up space and easing integration. The ethernet port allows direct control of multiple devices, and the included port expansion adapter makes it easy to add traditional control ports directly at the touchpanel.

The port expansion adapter provides control directly from the touchpanel, with x2 bi-directional RS-232 ports, x1 digital input, x1 IR port and x2 relays. Installers can customise the control systems with Extron GUI Designer software, while configurations comes through Global Configurator Plus or Global Configurator Professional.

"We designed these new TouchLink Pro control systems in response to customers' requests for a convenient, all-in-one touchpanel and control processor," Extron says. "We've also added a number of control ports to the back of each touchpanel for convenient connections to a broad variety of AV devices."
