---

Motorola takes on wireless video streaming with its VAP2400-- using wifi to carry video content throughout clients' homes.

It delivers an array of services, including multi-room DVR and digital content sharing, with low latency and near-zero packet loss. Motorola says it is the first IPTV video bridge solution to offer 4x4 beamforming. It should also handle multiple concurrent HD streaming through multiple walls.

It also supports TR-069 remote management, while it can self-install via auto-detection and auto-provisioning capabilities.

The company says the VAP2400 should be available for global delivery from Q3 2011.
