Crestron upgrades its Cameo keypad range-- this time focusing on matching the keypads' look with current interior design trends.

The upgraded range offers what Crestron describes as combining "contemporary stylings with highly customisable system design options".

New split-button designs allow for an additional x2 buttons per keypad, as well as increasing customisation options-- where the extra buttons are ideal for volume control or light dimming while freeing up space for extra lighting zone/audio source presets.

Meanwhile auto-dimmable backlit text and LED feedback provide button function indication.

The flush mounted keypads have a sleek profile and don't need a gang box. Built-in Verisport control ports allow for local device connection, contact closures and other integration solutions.
