

Bang & Olufsen presents the first results of its partnership with LG at IFA 2017-- the BeoVision Eclipse, a combination of the design B& O is famous for and Korean OLED technology.

The Danish TV maker announced the ["strategic technology partnership" with LG](#) back in March 2016. The BeoVision Eclipse is the kind of TV one would expect from the company, built out of a mix of metal and fabric. It sits on top of a motorised floor stand (which can move across the floor, as well as swivel) and offers a 55- or 65-inch 4K resolution OLED panel promising "absolute black and infinite contrast ratio" together with HDR capabilities.

Customers can replace the floor stand with a motorised or manual wall bracket, while control comes through the BeoRemote One BT remote. On the audio side, it carries a 450W 3-channel soundbar customers can customise with a choice of aluminium or different coloured fabrics. One can also add other BeoLab loudspeakers, with the TV speaker acting as centre channel.

Another interesting piece of LG technology found inside the Eclipse is webOS 3.5-- providing the TV with easy access to streaming services such as Netflix, YouTube and Deezer, built-in Spotify Connect, Chromecast and AirPlay audio support and simple Bluetooth streaming.

The BeoVision Eclipse should hit the market from September 2017.
