A number of Stewart Filmscreen projection solutions make a European debut at ISE 2013-- the Visionary Electrimask, Mystik!, Sabre, Director's Choice 100, Projection Ports and CIMA.

The Visionary ElectriMask extends the Vision Electriscreen (VE) screen by incorporating masking panels, providing multiple aspect ratios. It has a screen housing one can install during rough framing, with the screen fabric and masking retained at the factory to install separately post-construction.

For retail, personal or public venue applications demanding a 2-piece projection solution Stewart has Mystik!, a self-adhesive projection material designed for digital signage use. One can also apply the screen to windows or glass doors to create a transparent projection screen.

Another Stewart offering at ISE 2013 is Sabre, with a 0.25-inch beveled frame. It is standard in most popular architectural finishes, with custom finishes and colour matching also available, together with an optional inlaid Velux bar.

Also making an appearance is the latest Director's Choice masking screen system-- the DC-100, an enhancement for Directors Choice and Directors Choice 2.0 systems up to 14' wide. It features a 10-inch profile all round and 10-inch depth with fully closing horizontal masking.

Meanwhile Projection Ports reduce projector lighting backscatter by isolating projector noise without affecting contrast or image fidelity. Handmade in optical glass, Projection Ports are available in custom sizes in single or double pane glass versions.

And finally the CIMA line offers basic screen configurations in either NEVE white (ideal for applications where lighting control is available) or TIBURON gray (for applications with less lighting control) materials.
