Optoma presents an Alexa-enabled version of the UHD51A projector-- the UHD51ALVe, a number featuring an increase in brightness to 3200 lumens, making it ideal for media room applications, as well as voice control.

Alexa allows users to adjust volume, switch inputs and launch controls through the spoken word. As for the actual projector, it offers HDR compatibility, HDCP 2.2 support and stereo speakers, as well as 3D content playback. An in-built media player handles 4K content from a USB stick, while PureMotion frame-interpolation reduces motion blur and image judder on fast motion footage.

Vertical lens shift allows for easy installation, and Amazon Colour technology includes an enhanced colour wheel with multiple modes and settings on offer. A reference mode reproduces Rec.709 HDTV broadcast specification colours. Connectivity comes through x2 HDMI inputs.

"As the number one brand for 4K UHD projectors worldwide, we're excited to build on the success of the UHD51A with this higher brightness model," Optoma says. "This extra brightness for lights on viewing, great image quality and built-in smart home features make this a truly compelling entertainment solution."
