---

Stewart Filmscreen displays its Silver 5D screen material at ISE 2011-- offering passive 3D polarisation as well as maintaining performance for 2D material.

The company also says the material offers a wider viewing cone than previously available, with increased uniformity reducing hot spotting.

Compatible with AcoustiMask masking system and CineCurve (Stewart's own curved screen wall), the screen carries MicroPerforation, making it acoustically transparent.

It comes in sizes of up to 40" x 90".
