Blink announces a first outdoor camera-- the Blink XT, a small 1080p wireless camera able to run for over 2 years on a pair of regular lithium AA batteries customers can place just about anywhere.

Like other Blink cameras the XT features a 110-degree field of view and uses the same mounting system, only with the addition of IP-65-rated construction and infrared night vision. It does need to be in range of a wifi signal, but once connected to the internet the camera provides Alexa integration and free cloud-based storage for the viewing of 5-60 second clips triggered by the built-in motion sensor via iOS and Android Home Monitor app.

Users can also pair the XT with indoor Blink cameras to create a home security network.

“After much anticipation, we are thrilled to announce our affordable outdoor camera so both loyal Blink customers and new users alike can fully protect their homes day or night, no matter the season,” the company says. “Our customers have been anxious for a weatherproof model, and this new camera illustrates Blink’s commitment to developing integrated products that serve consumers’ home protection needs while integrating flawlessly into their lifestyles.”
