HAI's Wireless Driveway Sensor 63A00-1 uses Earth's magnetic field to detect passing metal objects (presumably from automobiles to UFOs).

It can be used to turn on outdoor lighting upon approach or to alert homeowners when a visitor has entered the driveway. Since the 63A00-1 is wireless, there is no digging or underground cable required. The Wireless Driveway Sensor has two unique mounting options via the included stake or post/wall mount.

"This is a great value-add product for larger projects," explains HAI President, Jay McLellan. "Installation is easy for our dealers, and the additional benefit of showing driveway surveillance video when a car enters the driveway is an often requested feature."

Available during Q2, Wireless Driveway Sensor is part of HAI's wireless security product line, and requires use with HAI 64 Zone Wireless Receiver.
