---

Igloohome announces a pair of smart home security products-- the Deadbolt 2S, described by the company as the slimmest smart deadbolt in the world, and the Smart Keybox 2 connected lockbox.

The Deadbolt 2S is 11mm thick at the front panel, and provides keyless access to homes via either Bluetooth keys or PIN codes created through companion Igloohome app. The physical key remains an option as backup, and the Deadbolt 2S needs no internet connectivity, making it safe from wifi hacking attacks. Finally, customers renting out property via Airbnb can also synchronise the Deadbolt 2S with a listing calendar to automatically create PIN codes for guests. Further features include a tamper alarm, decoy security code, privacy mode and auto-relocking.

Meanwhile the Keybox 2 is a smart lockbox (or mini safe) for the storage of things such as keys and cards. It can be shackled on firm structures or mounted to a wall, and is aimed for use in properties on home-sharing platforms such as Airbnb. Carbon steel construction promises resistance to impact and IP65 certification, and unlocking takes place using PIN codes or Bluetooth keys. The Igloohome app provides easy management.

In addition, Igloohome provides APIs and SDKs for project partners (such as hotel chains) to seamlessly integrate the solutions into existing smart ecosystems.
