Savant introduces a suite of what it calls "Savant Entry"-- a series of products allowing homeowners to see and communicate with anyone approaching a house entry point, such as the front door, side door, garage or gate.

Introduced as part of the Savant 8.9 software and hardware release, the Entry solution sends notifications to homeowners via Savant Pro App secure encrypted connection. Users can respond and unlock the door or gate, as well as check via video intercom on anyone approaching the entry point. They can even simply monitor the status of an entry point, without anyone ringing the bell.

The Entry solutions are designed to work from both inside the home or remotely within the Savant Pro 8 iOS/Android app. In addition, the solution promises an array of premium features, including high-powered night vision capability, advanced motion detection with available notifications and up to 3 months of video storage for events at the door.

Installers can deliver a tailored user experience. For instance, the buttons are customisable to trigger any function within the Savant system, such as door lock/unlock, lights on/off, alarm trigger, instant access to Savant Scenes and more.

The system is designed with 2N to offer a "unique entry point experience" to work within the Savant ecosystem. Entry hardware includes a small single-station solution with a doorbell and video camera or a large interface with a keypad. Also available is a heavy duty unit with an integrated keypad for applications demanding extra durability, such as remote gate entry. Pre-installation back-boxes are available for both surface and flush mounting options.
