---

DoorBird announces the D2101KV-- an IP door intercom solution incorporating a one-call button, a doorbell and a multifunctional keypad, making it ideal for both residential and commercial properties.

The one-call button is backlit, helping users easily find the product, and users can set the button to operate as either a call button or automatic door opener within individually set time windows. The keypad features 12 backlit buttons, while a companion app provides means to view visitor history, push notifications, PIN codes, scheduling and permissions for users to operate the keypad.

One can generate and assign PIN codes from anywhere, and the integrated keypad can send HTTP requests to home automation and control systems to trigger events such as arming a burglar alarm or controlling motorised shades. The unit also houses a 180-degree wide-angle hemispheric lens camera and 2-way echo- and noise-canceling audio system, together with an RFID reader and 4D motion sensor.

The housing is waterproof with a stainless steel finish.
