Control4 announces Lighting Design and Fixture Compatibility Services-- an array of design tools and services helping installers in the sale and installation of wireless and panelised lighting systems.

“Lighting control is one of the fastest growing segments in home automation and presents massive opportunity for dealers," the company says. "The new services and tools we are unveiling are designed to help dealers expand their lighting business by providing best-in-class support through the entire sales cycle to final installation.”

Installers can submit projects to the System Design Service, a panel of Control4 experts providing verification and recommendations for use with Control4 and 3rd party products. One can also get installation guides, light fixture recommendations and modification suggestions for load schedules and construction plans.

Meanwhile a web-based lighting fixture compatibility database allows installers to search for Control4-compatible 3rd party lighting fixtures and bulbs. As for personalised keypad creation Composer Pro is complete with backlight colour customisation, engraving setup and online ordering.

Further design, sales and installation tools include a comprehensive lighting design guide, detailed CAD drawings, quick-reference cards and new showroom displays.
