The iKNiX RTI Gateway promises "effortless" KNX integration with RTI, being designed to make the integration of RTI with KNX HVAC, lighting and blind control simpler.

Supposedly the first controller configured using only ETS, the iKNiX ProServ supports 18 zones, 16 object max (1000 datapoints) and comes with an included RTI driver. The iKNiX Port Gateway acts as an interface for connecting to KNX/EIB on telegram (KNX/net/IP tunneling) and data point (KNX application layer) level. Installers can connect to KNX/EIB-bus everywhere over LAN, and bus connection over the internet is also possible.

"KNX is a highly flexible and interoperable lighting and building management system," the company says. "RTI is the most flexible control platform to add to a KNX installation and provides an ideal integration platform, linking the AV Control with the building management."

The iKNiX Gateway is shipping now.
