iDevices announces the Dimmer Switch-- a HomeKit-compatible replacement to traditional light switches featuring customisable dimming users can control via companion app, Home app or Siri.

The switch fits in standard rocking faceplates to integrate with existing lighting systems, with no extra wiring required. Installation should also be like any standard wall switch, with support for single pole, 3- and 4-way setups. The in-app dim range settings promise to prevent low-level bulb flickers, and it remembers the last brightness state.

A built-in LED night light provides illumination in the dark, and users can set it to any colour. As well as Siri, the switch is also compatible with Amazon Alexa and Google Assistant for use with Android devices.

The iDevices Dimmer Switch is available now.
