Frostdale's attractive nanogrid wireless light switches win a Red Dot 2011 design award.

Nanogrid switches have a wave-shaped button design and feature built-in energy logging (displayed via web or smartphone apps) alongside Z-wave lighting automation. They also carry temperature sensors-- meaning one can tie the switches' respective zones to a home's HVAC system without the need for temperature sensors.

The switches have a selection of interchangeable faceplates (in x5 different colours) also include lettering in braille to aid visually impaired users.
