Control4 announces the Control4 Puck Lighting (240V), a ZigBee-enabled smart switch and dimmer solution working with 3rd-party keypads designed to fit standard round and square wall boxes used in EMEA territories.

It works with a variety of switch types, including momentary and latching switches.

Ideal for both new constructions and retrofit installations, it works including incandescent, halogen, magnetic low-voltage, electronic low-voltage, fluorescent, compact fluorescent and LED lighting.

Load type auto sensing ensures automatic dimming adjustment while over-wattage protection prevents the device from driving a too-high load by shutting down power to the load before it over heats.
