AVFoundry starts shipping the VideoForge-- a portable test pattern generator installers can use either independently or incorporate with Spectracal CalMAN software.

It provides an HDMI output and the video signals needed for the testing, calibration and servicing of HD displays (including 3D displays) with 3 distinct control interfaces.

First the VideoForge uses an XML-RPC control interface for automated control. Second it features an Adobe Flash-based control panel for interactive control. Finally one can control the VideoForge with programmable IR remote for standalone operations.

Every test pattern can be displayed in a 3D video format, with patterns showing the same image in both left/right eye frames and true stereo patterns available from JPG and PNG files on SD card.

Meanwhile independent on/off left and right eye image gating allows for stereo separation or left/right crosstalk testing and measurement.
